

**Please note that Cypress is an Infineon Technologies Company.**

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

**Continuity of document content**

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

**Continuity of ordering part numbers**

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

## Features

- Temperature range
  - $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$
- Pin and function compatible with CY7C199C
- High speed
  - $t_{AA} = 10\text{ ns}$
- Low active power
  - $I_{CC} = 80\text{ mA}$  at  $10\text{ ns}$
- Low CMOS standby power
  - $I_{SB2} = 3\text{ mA}$
- 2.0 V data retention
- Automatic power-down when deselected
- Complementary metal oxide semiconductor (CMOS) for optimum speed/power
- Transistor-transistor logic (TTL) compatible inputs and outputs
- Easy memory expansion with  $\overline{\text{CE}}$  and  $\overline{\text{OE}}$  features
- Available in Pb-free 28-pin 300-Mil-wide molded small outline J-lead package (SOJ) and 28-pin thin small outline package (TSOP) I packages

## Functional Description

The CY7C199D is a high performance CMOS static RAM organized as 32,768 words by 8-bits. Easy memory expansion is provided by an active LOW chip enable ( $\overline{\text{CE}}$ ), an active LOW output enable ( $\overline{\text{OE}}$ ) and tri-state drivers. This device has an automatic power-down feature, reducing the power consumption when deselected. The input and output pins ( $\text{I/O}_0$  through  $\text{I/O}_7$ ) are placed in a high impedance state when the device is deselected ( $\overline{\text{CE}}$  HIGH), the outputs are disabled ( $\overline{\text{OE}}$  HIGH), or during a write operation ( $\overline{\text{CE}}$  LOW and  $\overline{\text{WE}}$  LOW).

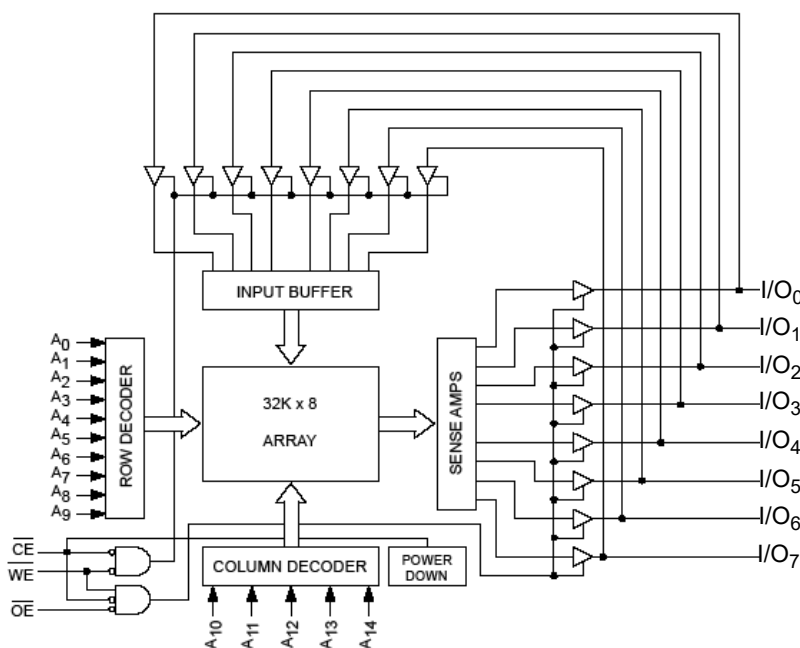

Write to the device by taking chip enable ( $\overline{\text{CE}}$ ) and write enable ( $\overline{\text{WE}}$ ) inputs LOW. Data on the eight I/O pins ( $\text{I/O}_0$  through  $\text{I/O}_7$ ) is then written into the location specified on the address pins ( $\text{A}_0$  through  $\text{A}_{14}$ ).

Read from the device by taking chip enable ( $\overline{\text{CE}}$ ) and output enable ( $\overline{\text{OE}}$ ) LOW while forcing write enable ( $\overline{\text{WE}}$ ) HIGH. Under these conditions, the contents of the memory location specified by the address pins appears on the I/O pins.

The CY7C199D device is suitable for interfacing with processors that have TTL I/P levels. It is not suitable for processors that require CMOS I/P levels. Please see [Electrical Characteristics on page 4](#) for more details and suggested alternatives.

Description	-10 (Industrial)	Unit
Maximum access time	10	ns
Maximum operating current	80	mA
Maximum CMOS standby current	3	mA

## Maximum Ratings

Exceeding the maximum ratings may impair the useful life of the device. These user guidelines are not tested.

Storage temperature ..... -65 °C to +150 °C

Ambient temperature

with power applied ..... -55 °C to +125 °C

Supply voltage

on  $V_{CC}$  to relative GND <sup>[1]</sup> ..... -0.5 V to +6.0 V

DC voltage applied to outputs

in high Z State <sup>[1]</sup> ..... -0.5 V to  $V_{CC} + 0.5$  V

DC input voltage <sup>[1]</sup> ..... -0.5 V to  $V_{CC} + 0.5$  V

Output current into outputs (LOW) ..... 20 mA

Static discharge voltage

(per MIL-STD-883, method 3015) ..... > 2,001 V

Latch-up current ..... > 140 mA

### Note

- $V_{IL(min)} = -2.0$  V and  $V_{IH(max)} = V_{CC} + 1$  V for pulse durations of less than 5 ns.
- Please note that the maximum  $V_{OH}$  limit does not exceed minimum CMOS  $V_{IH}$  of 3.5 V. If you are interfacing this SRAM with 5 V legacy processors that require a minimum  $V_{IH}$  of 3.5 V, please refer to Application Note [AN6081](#) for technical details and options you may consider.

## AC Test Loads and Waveforms

Figure 3. AC Test Loads and Waveforms <sup>[4]</sup>

### Notes

- Tested initially and after any design or process changes that may affect these parameters.
- AC characteristics (except high Z) are tested using the load conditions shown in Figure 3 (a). High Z characteristics are tested for all speeds using the test load shown in Figure 3 (c).

## Data Retention Characteristics

$t_R^{[6]}$	Operation recovery time		15	–	ns

## Data Retention Waveform

Figure 4. Data Retention Waveform

### Notes

- Tested initially and after any design or process changes that may affect these parameters.
- Full device operation requires linear  $V_{CC}$  ramp from  $V_{DR}$  to  $V_{CC(min)} \geq 50\text{ }\mu\text{s}$  or stable at  $V_{CC(min)} \geq 50\text{ }\mu\text{s}$ .

### Notes

- Test conditions assume signal transition time of 3 ns or less for all speeds, timing reference levels of 1.5 V, input pulse levels of 0 to 3.0 V, and output loading of the specified  $I_{\text{OL}}/I_{\text{OH}}$  and 30-pF load capacitance.
- $t_{\text{POWER}}$  gives the minimum amount of time that the power supply should be at typical  $V_{\text{CC}}$  values until the first memory access can be performed.
- At any given temperature and voltage condition,  $t_{\text{HZCE}}$  is less than  $t_{\text{LZCE}}$ ,  $t_{\text{HZOE}}$  is less than  $t_{\text{LZOE}}$ , and  $t_{\text{HZWE}}$  is less than  $t_{\text{LZWE}}$  for any given device.
- $t_{\text{HZOE}}$ ,  $t_{\text{HZCE}}$ , and  $t_{\text{HZWE}}$  are specified with  $C_L = 5$  pF as in part (b) of Figure 3 on page 5. Transition is measured  $\pm 200$  mV from steady-state voltage.
- This parameter is guaranteed by design and is not tested.
- The internal write time of the memory is defined by the overlap of  $\overline{\text{CE}}$  LOW and  $\overline{\text{WE}}$  LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input setup and hold timing should be referenced to the rising edge of the signal that terminates the write.
- The minimum write cycle time for Write Cycle No. 3 ( $\overline{\text{WE}}$  controlled,  $\overline{\text{OE}}$  LOW) is the sum of  $t_{\text{HZWE}}$  and  $t_{\text{SD}}$ .

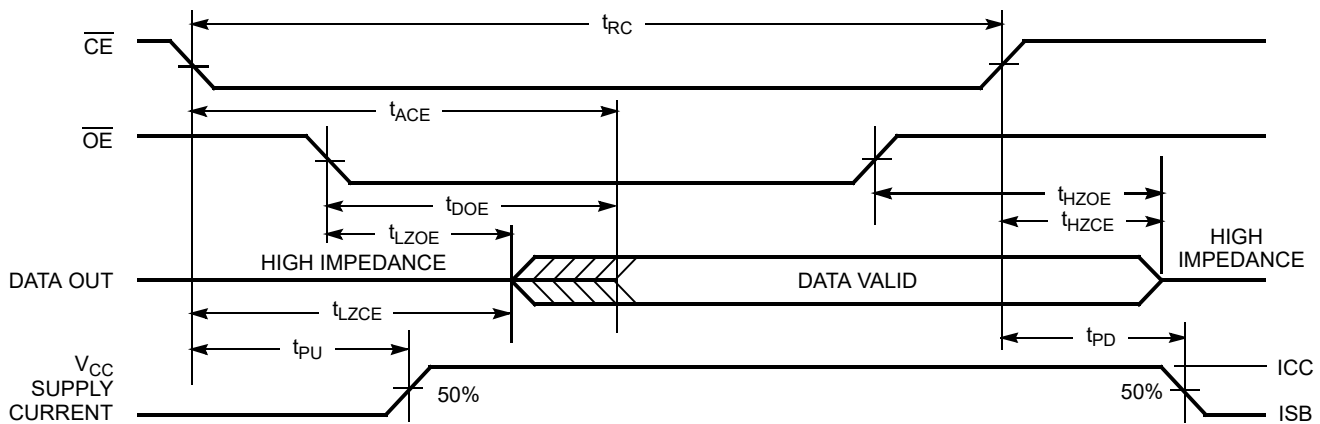

## Switching Waveforms

**Figure 5. Read Cycle No. 1 (Address Transition Controlled)** [14, 15]

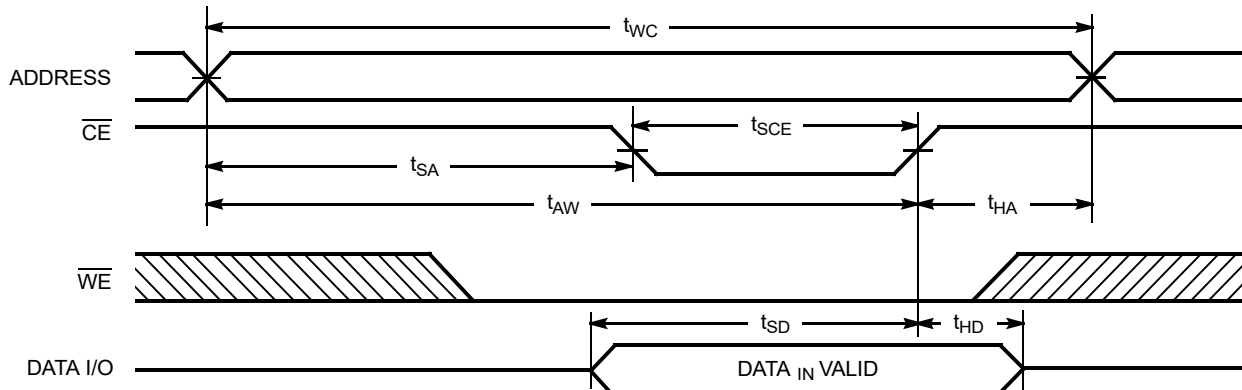

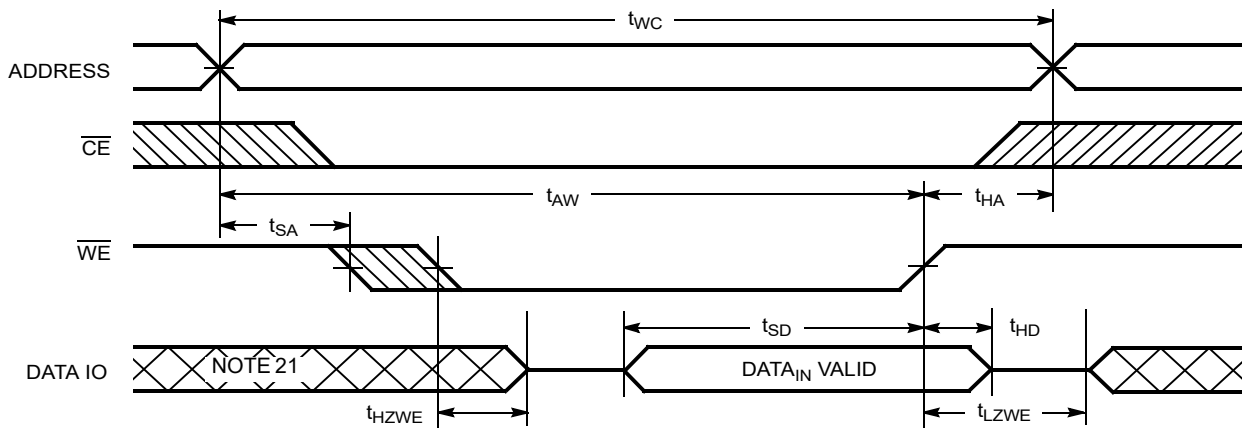

**Figure 6. Read Cycle No. 2 ( $\overline{OE}$  Controlled)** [15, 16]

### Notes

- 14. Device is continuously selected.  $\overline{OE}$ ,  $\overline{CE} = V_{IL}$ .
- 15.  $\overline{WE}$  is HIGH for read cycle.
- 16. Address valid prior to or coincident with  $\overline{CE}$  transition LOW.

**Switching Waveforms (continued)**
**Figure 7. Write Cycle No. 1 ( $\overline{\text{CE}}$  Controlled) [17, 18, 19]**

**Figure 8. Write Cycle No. 3 ( $\overline{\text{WE}}$  Controlled,  $\overline{\text{OE}}$  LOW) [19, 20]**

**Notes**

17. The internal write time of the memory is defined by the overlap of  $\overline{\text{CE}}$  LOW and  $\overline{\text{WE}}$  LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input setup and hold timing should be referenced to the rising edge of the signal that terminates the write.

18. Data I/O is high impedance if  $\overline{\text{OE}} = V_{IH}$ .

19. If  $\overline{\text{CE}}$  goes HIGH simultaneously with  $\overline{\text{WE}}$  HIGH, the output remains in a high-impedance state.

20. The minimum write cycle time for Write Cycle No. 3 ( $\overline{\text{WE}}$  controlled,  $\overline{\text{OE}}$  LOW) is the sum of  $t_{HZWE}$  and  $t_{SD}$ .

21. During this period the I/Os are in the output state and input signals should not be applied.

Any information provided in this document, including any sample design information or programming code, is provided only for reference purposes. It is the responsibility of the user of this document to properly design, program, and test the functionality and safety of any application made of this information and any resulting product. "High-Risk Device" means any device or system whose failure could cause personal injury, death, or property damage. Examples of High-Risk Devices are weapons, nuclear installations, surgical implants, and other medical devices. "Critical Component" means any component of a High-Risk Device whose failure to perform can be reasonably expected to cause, directly or indirectly, the failure of the High-Risk Device, or to affect its safety or effectiveness. Cypress is not liable, in whole or in part, and you shall and hereby do release Cypress from any claim, damage, or other liability arising from any use of a Cypress product as a Critical Component in a High-Risk Device. You shall indemnify and hold Cypress, its directors, officers, employees, agents, affiliates, distributors, and assigns harmless from and against all claims, costs, damages, and expenses, arising out of any claim, including claims for product liability, personal injury or death, or property damage arising from any use of a Cypress product as a Critical Component in a High-Risk Device. Cypress products are not intended or authorized for use as a Critical Component in any High-Risk Device except to the limited extent that (i) Cypress's published data sheet for the product explicitly states Cypress has qualified the product for use in a specific High-Risk Device, or (ii) Cypress has given you advance written authorization to use the product as a Critical Component in the specific High-Risk Device and you have signed a separate indemnification agreement.
